Murine cAMP regulatory element binding protein A, mCREBa - useful for systematic analysis of structure and function of mCREBa and identification of those molecules with which it will react identification of those molecules with which it will react identification of those molecules with which it will react identification of the products of the mcNEBa such as contiding (mCREBa) protein. The products of the mCNEBa such as contibodies can be used for the recombinant production of the protein, to identify novel genes encoding binding partner polypeptides for conference of mcNEBa and identification of those molecules with which it will react, to identify inhibitors of mCNEBa binding to other natural binding conference and to generate rodents that fail to express a functional conference express a variant mCREBa, useful as models for studying the contivities of mCNEBa and mCNEBa modulators in vivo.

of longterm memory
Claim 32: Page 100-101; 160pp; English.

Claim 32: Page 100-101; 160pp; English.

The Drosophila CREB1 protein (R91295) is an enhancer-specific activator and a member of the CREBATF family. It is the product of a cDNA clone (T14025) obtd. from a Drosophila head cDNA library GREBI mediated transcriptional activation from CAMP-responsive element-contg. reporters in the Drosophila L2 cell line, but this activation was not dependent of protein kinase activity. Expression of the dCREB1 gene is associated with long-term memory in Drosophila dCREB1 can be used to manipulate memory, and transgenic insects expressing dCREB1 can be used to assess the effects of drugs on long-term memory formation.
                                                                                                                                                                                    324

This is the amino acid sequence of novel human tumour rejection
actigen precursor (TRAP) MAGE-C1, a novel member of the MAGE.

C family that may be recognised by cytotoxic T cells, leading to
lysis of the tumour cells which express it. MACE-C1 and MACE-C2.

C see WB1547) are expressed in a variety of tumours and in normal
c testis cells, but not by other normal cells. MAGE-C1 cDNA (see
V69720) was isolated from a melanoma LB373-MEL cDNA. MAGE-C1 and
ACE-C2 cDNAS (see V69726) are claimed, as are: expression vectors;
transformed or transfected cell lines (e.g. COS and CHO); an
isolated TRAP encoded by the cDNAs; a kit useful in a PCR based
isolated TRAP encoded by the cDNAs; a kit useful in a PCR based
c assay; a method for determining expression of a MACE-C1 gene using
the kit; a polytope comprising a number of tumour rejection
articles.

R81483-R81497 and R81499-R81546 represent mutations of the protein encoded by the human breast and ovarian cancer predisposing gene (BRCA1) (see R81481 for wild type protein). These mutations can be used as immunogens for antibody production. The mutant BRCA1 genes encoding these sequences have at least 1 mutation or polymorphism in comparison to the wild type cDNA (see T17438 for wild type). By detecting a germline

a tissue sample from a subject has a probe, corresponding to a fragment of the CDNA encoding the wild type BRCA1 sequence (or an allele-specific probe for a mutation of it), added to it. The conditions allow for hybridisation of the probe to the mRNA, and any hybridisation which occurs is detected. Alternatively the BRCA1 gene in the tissue sample is isolated, and a shift in electrophoretic mobility of single stranded DNA from the sample on a non-denaturing polyacrylamide gel indicates a neothasia associated with the BRCA1 locus. The methods may be used in gene therapy, protein replacement therapy and protein mimetics, and may be used to screen for drugs in cancer therapy.

Detection of t(1,19) break-point-associated genes E2A and pril-
in chromosomal translocation, and prods. useful in diagnosis and
therapy of human neoplasm, esp. acute lymphoblastic leukaemia
Disclosure; Fig 4A; 104pp; English.
An additional Glu390 is present in this protein compared with the
protein encoded by the sequence of Q13670.
A distinctive feature of the N-terminal domain of E2Aalpha is its
high content of proline and glycine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              286 GLPSASSFSSAPGATYGGVSSHTPPVSGADSLLGSRGTTAGSSGDALGKALASIYSPDHS

                                        New nucleic acid and polypeptide for mutant or polymorphic BRCA1

PT New nucleic acid and polypeptide for mutant or polymorphic BRCA1

PT add for diagnosis and therapy of human breast and ovarian cancer

PT and for diagnosing pre-disposition to these cancers

Claim 1; 218pp; English.

CC R81483-R81497 and R81499-R81546 represent mutations of the protein

CC GENCOMED by the human breast and ovarian cancer predisposing gene (BRCA1)

CS R81481 for wild type protein). These mutations can be used as immunogens for antibody production. The mutant BRCA1 genes encoding these sequences have at least 1 mutation or polymorphism in comparison to the wild type CDNA (see T17438 for wild type). By detecting a germline alteration in the wild type BRCA1 gene, a predisposition for breast and covarian cancer can be diagnosed. In one method BRCA1 mRNA isolated from a tissue sample from a subject has a probe, corresponding to a fragment of the cDNA encoding the wild type BRCA1 sequence (or an allele-specific of the probe to the mRNA, and any hybridisation which occurs is detected. Alternatively the BRCA1 gene In the tissue sample is cours is detected. Alternatively the BRCA1 gene In the tissue sample is cours is detected. Alternatively the BRCA1 gene In the tissue sample or a non-denaturing polyacrylamide gel indicates a conclated with the BRCA1 locus. The methods may be used in a non-denaturing polyacrylamide gel indicates and may and may the process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20;
                                                                                                                                                                                                                                                                                                                                                                     mutation. These methods or detection. The methods may be used incoplasta associated with the BRCA1 locus. The methods may be used therapy, protein replacement therapy and protein mimetics, and may be used to screen for drugs in cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    02-007-1996 (first entry)

The formal of the following pre-disposition to these cancers and for disposing pre-disposition to these cancers and for disposition pre-disposition to these cancers and for disposing pre-disposition to the following the following pre-disposition to the following production. The mutant BRCA1 genes encoding these sequences have at least 1 mutation or polymorphism in comparison to the wild type cDNA (see T17438 for wild type). By detecting a germline a tessue sample from a subject has a probe, corresponding to a fragment of the CDNA encoding the wild type BRCA1 sequence (or an allele-specific probe for a mutation of it), added to it. The conditions allow for the hybridisation of the probe to the mRNA, and any hybridisation which cours is detected. Alternatively the BRCA1 gene in the tissue sample is soluted, and a shift in electrophoretic mobility of single stranded DNA from the sample on a non-denaturing polyacrylamide gel indicates a condition. These methods of detection can also dispose a lesion conditions as a sociated with the BRCA1 locus. The methods may be used in sequence to the rapy, protein replacement therapy and protein mimetics, and may sequence the beautions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20;

Example 1; Fig 7B; 87pp; English.
This is the amino acid sequence of human LMR2-h, deduced from a LMR2-h cDMA clone (see V13452). Novel rat, human and mouse LMR1, LMR2 and LMR3 (see W48841-49) define a novel family of receptors that are structurally related to receptor tyrosine kinases (RTKS). They all share the distinct motifs that typically characterise this class of enzymes, but possess extremely short extracellular domains
                                                                                                                                                   12-0cT-1998 (first entry)
Human receptor tyrosine kinase LMR2_h.

and have C-terminal tails of unprecented length among RTKs. Expression of LMR1 and LMR3 is highly restricted to neuronal tissues with,minital expression in other adult or embryonic organs or in human tumour cell lines. LMR2 expression is limited to adult neuronal tissues, but is also very abundantly expressed in other non-neuronal foetal tissues and in numerous tumour cell lines. Based on restricted expression of all 3 LMRs to adult neuronal tissues and the up requilation of LMR2 in a wide variety of tumour cell lines, these proteins may be critical targets for neurodegenerative disorders or cancer. Anti-LMR antibodies may be sequence 1503 AA,

New nucleic acid and polypeptide for mutant or polymorphic BRCAI

The mode of diagnosis and therapy of human breast and ovarian cancer

The diagnosis and therapy of human breast and ovarian cancer

The diagnosing pre-disposition to these cancers

Claim 1; 218pp; English.

CC R81483-R81497 and R81499-R81546 represent mutations of the protein

CC R81483-R81497 and R81499-R81546 represent mutations of the protein

CC R81483-R81497 and R81499-R81546 represent mutations of the protein

CC R81483-R81497 and R81499-R81546 represent mutations of the protein

CC R81483-R81491 for wild type protein). These mutations can be used as immunogens for antibody production. The mutant BRCAI genes encoding the wild type ERCAI gene, a predisposition for breast and covarian cancer can be diagnosed. In one method, BRCAI mRNA isolated from a tissue sample from a subject has a probe, corresponding to a fragment of the cDNA encoding the wild type BRCAI sequence (or an allele-specific of the cDNA encoding the wild type BRCAI sequence (or an allele-specific occurs is detected. Alternatively the BRCAI gene in the tissue sample is solated a shift in electrophoretic mobility of single stranded DNA cc inclaims associated with the BRCAI locus. The methods may be used in mutation. These methods of detection can also diagnose a lesson and may increase and may considered with the BRCAI locus. The methods may be used in methods of detection can also diagnose a lesson and may and ma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New mutant allele(s) of the BRCA1 gene - useful for assessing susceptibility to inherited breast and ovarian cancer acceptability to inherited breast and ovarian cancer.

C claim 2: Page 71-75; 85pp; English.

C Translation products (R99437-48) of tumorigenic alleles #5803, 9601, 9815, 8403, 8203, 388, 6401, 4406, 10201, 7408, 582 and 77 (T42021-32) of the BRCA1 breast cancer susceptibility gene are (with the exception of the allele #8403 product) truncated variants of the wild-type product. The C-terminal portions of these truncated tumourigenic translation products can be used to generate specific binding cpds., such as antibodies, that are used culangonstically to distinguish non-tumorigenic wild-type and tumorigenic BRCA1 translation products in tissue samples.

Example 3: Column 105-112; 63pp; English.
W1000-11 are proteins encoded by BRCAI mutant alleles (T70064*75) from germline DNA and breast cancer patient tumours from chromosome 17q-1inked families. A mutation in allele #582 has led to the deletion of TCAA in exon 11 and a corresponding Stopl364stop substitution, leading to the predicted protein truncation shown in the present sequence. The nucleic acids can be used as probes in hybridisation assays for screening patients for susceptibility to breast, ovarian or prostatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               978 YRIPPLFPIKSFVKTKCKKNLLEENFEEHSMSPEREMGNENIPSTVSTISRNNIRENVFK 1037

                                                                                                                                                                                                                                                                                                                                                                                                                                                       causing breast cancer (laming) for the present and the present sequence represents a tumourogenic protein of the breast and ovarian cancer susceptibility gene (BRCA1). Exon 11 of the present allele ovarian cancer susceptibility gene (BRCA1). Exon 11 of the present allele ovarian cancer susceptibility gene (BRCA1). Exon 11 of the present allele ovarian cancer susceptibility gene (BRCA1). Exon 11 of the present allele other mutagenic alleles have also been identified (see V60560-71). The polypeptides are useful for the identification of specific mutations of BRCA1, and can be used to compare with the translation product from a patient to identify the mutation that is causing the disease. In this respect, they can also be used to raise allele specific antibodies. They can also be used for detection purposes. The antibodies can be used in binding assays e.g. ELICAA. The polypeptides can also be used for the treatment of breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mutation. These methods of detection can also diagnose a lesion neoplasia associated with the BRCA1 locus. The methods may be used in gene therapy, protein replacement therapy and protein mimetics, and may be used to screen for drugs in cancer therapy.

            NOTE: This is a 'working draft' sequence. It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 31 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
Insert size: 225000; agarose-fp
Insert size: 206861; sum-of-contigs
Quality coverage: 3.50 in Q20 bases; agarose-fp
Quality coverage: 3.75 in Q20 bases; sum-of-contigs

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with corresponding to the overlapping clone, as we submit sequences with the following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Ems., EMBL; Sw., SWISSPROT; Tr., TREMBL; Wp., WORMPEP; Information on the WORWEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP5-1104E15 is from the library RPCI-5 constructed at the Roswell Park Cancer Institute by the group of Pileter de Jong. For further details see http://bacpac.med.buffalo.edu/
                                                                                                                                                                                                                                  s sequence was generated from part of bacterial clone contigs of an chromosome 22, constructed by the Sanger Centre Chromosome 22 ping Group. Further information can be found at p://www.sanger.ac.uk/HGB/Chr22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TOR: pCYPAC.

TOR: pCYPAC.

ORTANT: This sequence is not the entire insert of clone

ORTANT: This sequence is not the entire insert of clone

1104E15 It may be shorter because we only sequence overlapping

tions once, or longer because we arrange for a small overlap

ween neighbouring submissions.

true left end of clone RP5-1104E15 is at 1 in this sequence.

true left end of clone CRA-206C7 is at 112356 in this sequence.

true right end of clone RP3-407F17 is at 83950 in this

uence. The end of this sequence overlaps with sequence AL008716.

Location/Qualifiers
May 28, 1999 this sequence version replaced g1:4902589. s sequence has been finished according to sequence map criteria follows. An attempt is made to resolve all sequencing problems, has compressions and repeats, but not necessarily within known otated human repeat sequence elements (e.g. Alu). Where the uence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3839. .4037
